Advisor: Allison Pacelli

Algebraic Number Theory Group - SMALL '08 Function Fields with Class Number Indivisible by a prime  $\ell$ 

A (1) > A (2) > A

#### Definition

A **number field** is a finite extension of  $\mathbb{Q}$ .

Algebraic Number Theory Group - SMALL '08 Function Fields with Class Number Indivisible by a prime  $\ell$ 

#### Definition

A **number field** is a finite extension of  $\mathbb{Q}$ .

#### Definition

A complex number is an **algebraic integer** if it is a root of some monic polynomial with coefficients in  $\mathbb{Z}$ .

イロト イヨト イヨト イヨト

#### Definition

A **number field** is a finite extension of  $\mathbb{Q}$ .

#### Definition

A complex number is an **algebraic integer** if it is a root of some monic polynomial with coefficients in  $\mathbb{Z}$ .

#### Definition

The **ring of integers** of a number field *K*, denoted by  $\mathcal{O}_K$ , is the set of all algebraic integers in *K*.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Remark

 $\mathcal{O}_K$  is not always a UFD.

#### Example

Let 
$$K = \mathbb{Q}(\sqrt{-6})$$
. Then  $\mathcal{O}_K = \mathbb{Z}[\sqrt{-6}]$ , and

$$-2 \cdot 3 = -6 = (\sqrt{-6})^2$$

but 2, 3, and  $\sqrt{-6}$  are irreducible in  $\mathbb{Z}[\sqrt{-6}]$ . Thus,  $\mathbb{Z}[\sqrt{-6}]$  is not a UFD.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Remark

 $\mathcal{O}_K$  is a Dedekind domain for any number field K.

Algebraic Number Theory Group - SMALL '08 Function Fields with Class Number Indivisible by a prime  $\ell$ 

(日)

#### Remark

 $\mathcal{O}_K$  is a Dedekind domain for any number field K.

#### Theorem

Every proper ideal in a Dedekind domain factors uniquely into a product of prime ideals.

< 同 > < 三 > <

#### Remark

 $\mathcal{O}_K$  is a Dedekind domain for any number field K.

#### Theorem

Every proper ideal in a Dedekind domain factors uniquely into a product of prime ideals.

#### Example

Let 
$$K = \mathbb{Q}(\sqrt{-6})$$
. Then  $\mathcal{O}_K = \mathbb{Z}[\sqrt{-6}]$ .

#### Remark

 $\mathcal{O}_K$  is a Dedekind domain for any number field K.

#### Theorem

Every proper ideal in a Dedekind domain factors uniquely into a product of prime ideals.

#### Example

Let 
$$K = \mathbb{Q}(\sqrt{-6})$$
. Then  $\mathcal{O}_K = \mathbb{Z}[\sqrt{-6}]$ .

$$egin{aligned} \langle -2 
angle &= \langle 2, \sqrt{-6} 
angle^2 \ \langle 3 
angle &= \langle 3, \sqrt{-6} 
angle^2 \ \langle \sqrt{-6} 
angle &= \langle 2, \sqrt{-6} 
angle \langle 3, \sqrt{-6} 
angle \end{aligned}$$

Algebraic Number Theory Group - SMALL '08 Function Fields with Class Number Indivisible by a prime  $\ell$ 

#### Remark

 $\mathcal{O}_K$  is a Dedekind domain for any number field K.

#### Theorem

Every proper ideal in a Dedekind domain factors uniquely into a product of prime ideals.

#### Example

Let 
$$K = \mathbb{Q}(\sqrt{-6})$$
. Then  $\mathcal{O}_K = \mathbb{Z}[\sqrt{-6}]$ .

$$egin{aligned} \langle -2 
angle &= \langle 2, \sqrt{-6} 
angle^2 \ \langle 3 
angle &= \langle 3, \sqrt{-6} 
angle^2 \ \langle \sqrt{-6} 
angle &= \langle 2, \sqrt{-6} 
angle \langle 3, \sqrt{-6} 
angle \end{aligned}$$

Note  $\langle -6 \rangle = \langle -2 \rangle \langle 3 \rangle = \langle \sqrt{-6} \rangle^2 = \langle 2, \sqrt{-6} \rangle^2 \langle 3, \sqrt{-6} \rangle^2.$ 

Function Fields with Class Number Indivisible by a prime  $\ell$ 

#### Nonzero ideals $I \sim J$ if aI = bJ for some nonzero $a, b \in \mathcal{O}_K$ .

Algebraic Number Theory Group - SMALL '08 Function Fields with Class Number Indivisible by a prime  $\ell$

ヘロマ ヘロマ ヘロマ ヘ

• Since the identity element of  $Cl_K$  is the class of principal ideals, then  $h_K = 1$  if and only if  $\mathcal{O}_K$  is a principal ideal domain (PID).

• (1) • (1) • (1)

- Since the identity element of  $Cl_K$  is the class of principal ideals, then  $h_K = 1$  if and only if  $\mathcal{O}_K$  is a principal ideal domain (PID).
- A PID is always a UFD, so  $\mathcal{O}_K$  is a UFD if  $h_K = 1$ .

A (B) > A (B) > A (B)

- Since the identity element of  $Cl_K$  is the class of principal ideals, then  $h_K = 1$  if and only if  $\mathcal{O}_K$  is a principal ideal domain (PID).
- A PID is always a UFD, so  $\mathcal{O}_K$  is a UFD if  $h_K = 1$ .

#### Theorem

For Dedekind domains,  $UFD \Leftrightarrow PID$ .

- Since the identity element of  $Cl_K$  is the class of principal ideals, then  $h_K = 1$  if and only if  $\mathcal{O}_K$  is a principal ideal domain (PID).
- A PID is always a UFD, so  $\mathcal{O}_K$  is a UFD if  $h_K = 1$ .

#### Theorem

For Dedekind domains, UFD  $\Leftrightarrow$  PID.

• Thus,  $\mathcal{O}_K$  is a UFD if and only if  $h_K = 1$ .

(I) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

- Since the identity element of  $Cl_K$  is the class of principal ideals, then  $h_K = 1$  if and only if  $\mathcal{O}_K$  is a principal ideal domain (PID).
- A PID is always a UFD, so  $\mathcal{O}_K$  is a UFD if  $h_K = 1$ .

- Thus,  $\mathcal{O}_K$  is a UFD if and only if  $h_K = 1$ .
- Roughly, the class number measures the closeness of O<sub>K</sub> to being a UFD.

# Polynomials

## Definition of fp's

Let p be a divisor of m such that either p is prime or p = 4. Define

$$\begin{split} f_p(\mathbf{x}) &= 5 \sum_{\substack{i=0\\i\equiv 0(5)}}^p \binom{p}{i} \mathbf{x}^{p-i} - \gamma \sum_{\substack{i=0\\i\equiv 1(5)}}^p \binom{p}{i} \mathbf{x}^{p-i} - (5+\gamma\omega) \sum_{\substack{i=0\\i\equiv 2(5)}}^p \binom{p}{i} \mathbf{x}^{p-i} \\ &+ \omega(\gamma-5) \sum_{\substack{i=0\\i\equiv 3(5)}}^p \binom{p}{i} \mathbf{x}^{p-i} + (\gamma+5\omega) \sum_{\substack{i=0\\i\equiv 4(5)}}^p \binom{p}{i} \mathbf{x}^{p-i} \\ f_4(\mathbf{x}) &= \mathbf{x}^4 - \frac{4}{5} \gamma \mathbf{x}^3 - (\frac{6}{5} \gamma \omega + 6) \mathbf{x}^2 + 4\omega (\frac{1}{5} \gamma - 1) \mathbf{x} + (\omega + \frac{\gamma}{5}) \end{split}$$

*Fact:* Each  $f_p(x)$  is Eisenstein with respect to the chosen prime  $\mathfrak{p} \subset \mathbb{Q}(\omega)$  lying over p, and thus each  $f_p(x)$  is irreducible over  $\mathbb{Q}(\omega)$ .

## The Rest of the Proof

 Reduce the problem to showing that f<sub>p</sub>(x) has no roots mod q.

## The Rest of the Proof

Reduce the problem to showing that f<sub>p</sub>(x) has no roots mod q.

### Theorem (Jordan)

Let *G* be a group acting on a finite set *X* with cardinality *n*. If  $n \ge 2$  and *G* acts transitively on *X*, then there is an element  $g \in G$  which acts on *X* without a fixed point.

### Theorem (Frobenius)

Let f be an irreducible polynomial over  $\mathbb{Q}(\omega)$  with Galois group G. The density of primes q for which f has no roots mod q exists, and is equal to 1/|G| times the number of  $\sigma \in G$  with no fixed points.

● How can we generalize this result to an arbitrary prime *l*?

Algebraic Number Theory Group - SMALL '08 Function Fields with Class Number Indivisible by a prime  $\ell$ 

- How can we generalize this result to an arbitrary prime  $\ell$ ?
- The  $\ell = 5$  case relied heavily on creating the chain of cyclic quintic extensions:

$$N_1 \subseteq N_2 \subseteq \cdots \subseteq N_{n-1} \subseteq N_n = \mathbb{F}_q(T).$$

< 🗇 > < 🖻 > < 🖻

- How can we generalize this result to an arbitrary prime  $\ell$ ?
- The l = 5 case relied heavily on creating the chain of cyclic quintic extensions:

$$N_1 \subseteq N_2 \subseteq \cdots \subseteq N_{n-1} \subseteq N_n = \mathbb{F}_q(T).$$

So, in order to use the same techniques in general, we need a polynomial that generates cyclic extensions of degree  $\ell$ .

$$f_p(X) = \sum_{\substack{j=0\\i\equiv j}}^{\ell-1} \sum_{\substack{i=0\\i\equiv j}}^{p} \binom{p}{i} (a_j \gamma + a_{j-1} \ell) X^{p-i}$$

where  $a_j = (\zeta^j - \zeta^{-j})/(\zeta - \zeta^{-1})$  and  $\gamma$  is chosen to make  $f_p$ Eisenstein for each  $p \mid m$ .

 The polynomial *f<sub>p</sub>* was chosen so that if *f<sub>p</sub>* has no roots mod *q*, then ℓζ + γ ∉ 𝔽<sub>*q*</sub>(ζ)<sup>*p*</sup>, and if *f*<sub>4</sub> has no roots mod *q*, then ℓζ + γ ∉ −4𝔽<sub>*q*</sub>(ζ)<sup>4</sup>.

<ロ> <四> <四> <四> <三> <三> <三> <三> <三> <三> <三

- Recall: We want  $\ell \zeta + \gamma \not\in \mathbb{F}_q(\zeta)^p$  for all p dividing m and  $\ell \zeta + \gamma \not\in -4\mathbb{F}_q(\zeta)^4$  if  $4 \mid m$ .
- For p a prime or p = 4, define a polynomial  $f_p(X) \in \mathbb{Q}(\omega)[X]$  as follows:

$$f_p(X) = \sum_{\substack{j=0\\i\equiv j}}^{\ell-1} \sum_{\substack{i=0\\i\equiv j}}^{p} \binom{p}{i} (a_j \gamma + a_{j-1} \ell) X^{p-i}$$

where  $a_j = (\zeta^j - \zeta^{-j})/(\zeta - \zeta^{-1})$  and  $\gamma$  is chosen to make  $f_p$ Eisenstein for each  $p \mid m$ .

- The polynomial *f<sub>p</sub>* was chosen so that if *f<sub>p</sub>* has no roots mod *q*, then ℓζ + γ ∉ 𝔽<sub>*q*</sub>(ζ)<sup>*p*</sup>, and if *f*<sub>4</sub> has no roots mod *q*, then ℓζ + γ ∉ −4𝔽<sub>*q*</sub>(ζ)<sup>4</sup>.
- The remainder of the proof is identical to the  $\ell = 5$  case.

The methods used in the function field case do not generalize to number fields.

<日</th>

The methods used in the function field case do not generalize to number fields.

Function fields have nonzero characteristic, hence we can choose *q* so that F<sub>q</sub> will have certain useful properties, such as ω ∈ F<sub>q</sub> and ζ ∉ F<sub>q</sub>. Number fields always have characteristic 0, and the base field is always Q.

The methods used in the function field case do not generalize to number fields.

- Function fields have nonzero characteristic, hence we can choose *q* so that 𝔽<sub>q</sub> will have certain useful properties, such as ω ∈ 𝔽<sub>q</sub> and ζ ∉ 𝔽<sub>q</sub>. Number fields always have characteristic 0, and the base field is always ℚ.
- In the function field case, we can construct a chain of fields

$$N_1 \subseteq N_2 \subseteq \cdots \subseteq N_{n-1} \subseteq N_n = \mathbb{F}_q(T)$$

leading up to the base field  $\mathbb{F}_q(T)$ . In number fields, the base field  $\mathbb{Q}$  has no proper nontrivial subfields.

• Tools used in the function field case are unavailable in the number field case, such as the genus of a curve and the Riemann-Hurwitz equation.
